

## PS/ALI (Private Switch/Automatic Location Identification) Policy

Integra Telecom (INTEGRA) provides one emergency response location per trunk group for T1 based services and one per line for analog services.

If more than one emergency response location per trunk group is required, a PS/ALI solution must be implemented. INTEGRA refers PS/ALI to other providers.

Typically PBX owners (actually any multi-line telephone system owner) implement PS/ALI to ensure that the location of each station is identified to the 911/E911 system.

### Standard Emergency Response Diagram (NO PS/ALI)

INTEGRA will provide Customer with the following emergency service addresses:

- **For Basic Business Lines** - INTEGRA programs the emergency response location to be the service address of each line.
- **For any Integrated T1 Business Line Service** - INTEGRA programs the emergency response location to be the service address of each line.
- **For Basic Business Line over T1** - INTEGRA programs one emergency response location to be the service address for each line.
- **For Basic Voice Trunks or PRI Voice Trunks** - INTEGRA programs one emergency response location to be the service address for each circuit.

INTEGRA refers all PS/ALI to third parties. If Customer implements PS/ALI, Customer must coordinate with the Integra corporate 911 Administrator to ensure station identification pass-through is enabled; otherwise, the INTEGRA default actions outlined above will remain in place.
